

Table of Contents

Sl. No.	Name of the Experiment	Page
1	Basic Signal Generation and Visualization.	
2	Signal Operations — Shifting, Scaling, and Reversal.	
3	Even and Odd Decomposition of Discrete Signals	
4	Sampling of Analog Signal — Nyquist Rate Analysis	
5	Aliasing Demonstration in Sampling	
6	Signal Reconstruction from Samples Using Interpolation	
7	Uniform Quantization of a Sine Wave	
8	Quantization Error Analysis	
9	Effect of Bit Resolution on Quantization Quality	
10	Discrete Fourier Transform — Manual vs. Built-in Implementation	
11	Frequency Spectrum Analysis of Composite Signals	
12	Short-Time Fourier Transform and Spectrogram Analysis	
13	Statistical Measures of Discrete Signals	
14	Correlation and Covariance Analysis	
15	Random Signal Analysis — White Gaussian Noise	
16	FIR Low-Pass Filter Design and Noise Reduction	
17	High-Pass Filter Design — DC Component Removal	
18	IIR Butterworth Filter Design and Application	
19	Frequency Response Analysis of Digital Filters	
20	Comparative Analysis of FIR vs. IIR Filters	
21	Noise Removal Project — Signal-to-Noise Ratio Evaluation	
22	Speech Signal Analysis — Real-World Audio Processing	
23	Aliasing and Anti-Aliasing Filter Combined Analysis	
24	Basic Signal Classification Using Feature Extraction
